Data & Analytics

Effective use of healthcare data is the foundation of improving quality and reducing costs.

Healthcare is an information enterprise, and the patient experience is shaped by data. You must be able to translate data into processes for continual improvement within clinical operations and the patient experience. Used properly, data can uncover areas of waste and redundancy, and inform strategies for producing consistent, highest quality care.

HORNE Healthcare teaches providers how to use healthcare data to eliminate variations in care across the clinical organization. In partnership with a leading healthcare data warehousing and analytics firm, HORNE helps you identify process improvements and build a secure system that meets your needs. These customized resources and experienced counsel supply you with an accurate, usable snapshot of the care you provide.

Translating data into useful strategies for improving the organization should not be a drain on already limited resources. HORNE Healthcare can help you implement and use technology to reduce clinical waste and variations in care, so you can make continual positive changes to care delivery.
